

SAP Data Conversion Readiness Assessment

Legacy Vendor Master & Accounts Payable Invoice Data | Portfolio Project by Karma Yangchen Gurung | September 2026

Note: All data in this project is synthetic, generated to simulate a typical legacy AP system. No client or employer data was used. Target field names follow standard SAP vendor and FI document structures.

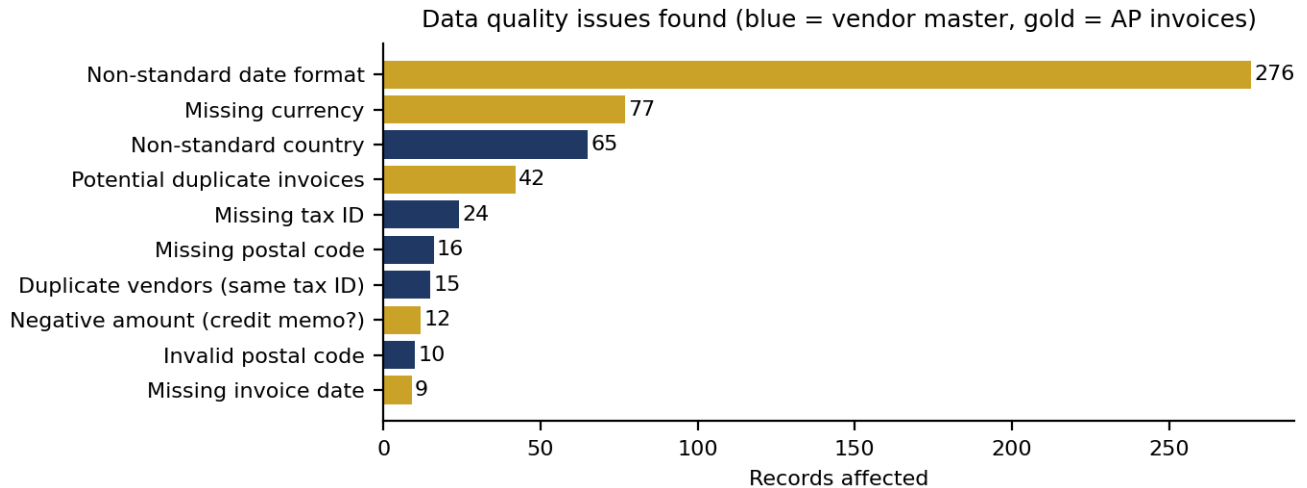

1. Objective

Assess whether a legacy accounts payable dataset is ready to migrate into SAP, document the mapping and cleansing rules required, flag records that should not be loaded, and reconcile record counts and dollar totals so every legacy record is accounted for. Scope: **415 vendor records** and **3,042 invoices** totaling **\$6,494,651.50**.

2. Field Mapping: Legacy to SAP

Legacy field	SAP target (table-field)	Transformation / validation rule
legacy_vendor_id	LFA1-LIFNR (vendor number)	Keep as cross-reference; merge duplicates to one surviving vendor
vendor_name	LFA1-NAME1	Trim spaces; standardize case; compare normalized names to catch duplicates
street / city / postal_code	LFA1-STRAS / ORT01 / PSTLZ	Postal code must be 5 digits; hold record if missing or invalid
country	LFA1-LAND1	Standardize 'USA', 'United States', blank → 'US' (ISO code)
tax_id	LFA1-STCD1 (tax number)	Required; used as the primary duplicate-vendor key
vendor_invoice_ref	BKPF-XBLNR (reference)	Trim, uppercase, strip suffixes like '-1' before duplicate check
invoice_date	BKPF-BLDAT (document date)	Convert MM/DD/YYYY to YYYY-MM-DD; hold if missing
amount / currency	BSEG-WRBTR / BKPF-WAERS	Negative amounts routed to credit memo load; blank currency defaults to USD

3. Data Profiling Results

The most common issue was formatting (non-standard country values and date formats), which can be fixed automatically. The higher-risk issues were missing tax IDs, invalid postal codes, and duplicates, which need business review before load.

4. Duplicate Detection

Vendors: 15 vendors shared a tax ID with another record under a slightly different name (for example, uppercase or 'Inc.' vs 'INC'). These were merged into one surviving vendor, and their invoices were re-pointed to it.

Invoices: matching on vendor + normalized reference + amount found **42 potential duplicate invoices worth \$98,527.02**: 14 exact matches and 28 that only matched after normalizing the reference (extra spaces, lowercase letters, or a '-1' suffix). Exact-match-only logic would have missed two-thirds of them.

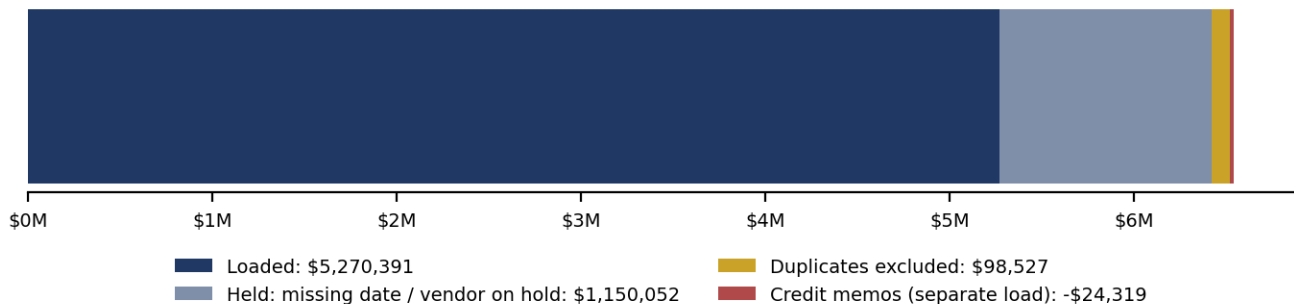

Legacy invoice	Vendor	Reference (as entered)	Date	Amount	How it matched
INV-500966	V10005	'D26558'	01/08/2026	\$2,669.11	Exact match
INV-900966	V10005	'D26558'	01/08/2026	\$2,669.11	Exact match
INV-501997	V10048	'C82321'	2025-09-21	\$1,908.51	'-1' suffix added
INV-901997	V10048	'C82321-1'	2025-09-21	\$1,908.51	'-1' suffix added
INV-900497	V10079	'D74639-1'	2026-04-27	\$1,137.69	'-1' suffix added
INV-500497	V10079	'D74639'	2026-04-27	\$1,137.69	'-1' suffix added
INV-502862	V10034	'B40328'	01/03/2026	\$1,180.93	Leading space + lowercase
INV-902862	V10034	' b40328'	01/03/2026	\$1,180.93	Leading space + lowercase

Sample duplicate pairs: one exact match and three that only matched after normalizing the reference.

5. Load Reconciliation

Category	Invoices	Amount	Action
Legacy total	3,042	\$6,494,651.50	Starting point
Ready to load	2,443	\$5,270,391.23	Load to SAP
Potential duplicates	42	\$98,527.02	Exclude; send to AP for review and possible recovery
On hold	546	\$1,150,051.97	Missing date, or vendor held for missing tax ID / postal code
Credit memos	11	-\$24,318.72	Load separately as credit documents
Check: categories sum to legacy total	3,042	\$6,494,651.50	Reconciled

Where every legacy invoice dollar went

Vendor master: 415 legacy records → 15 merged as duplicates → 50 held for missing tax ID or invalid postal code → **350 ready to load**.

6. Recommendations

- **Clean vendors first.** 50 held vendors block 546 invoices (\$1,150,051.97). Collecting missing tax IDs and postal codes would release most of them.
- **Review duplicates before go-live.** \$98,527.02 in potential duplicate payments should be confirmed with AP and, where already paid, pursued for recovery.
- **Use normalized matching.** Duplicate checks should standardize references (trim, uppercase, remove suffixes), not rely on exact matches.
- **Prevent repeats in SAP.** Make tax ID mandatory in vendor creation and enable SAP's duplicate invoice check on vendor, reference, amount, and date.
- **Reconcile every load.** Sign off on counts and totals for each load cycle so no record is lost or double-counted.

Tools: Python (pandas) for profiling, cleansing, and reconciliation; matplotlib for charts.
